I get a lot of spam and the majority of them have HTML links imbedded. NST is catching most of them but probably 1 of 10 gets through. Is editing the settings a good way to get them all?

Unfortunately, there are still people sending legit emails using HTML. But if you can afford to get rid of all HTML mails, try to change the score of the HTML_MESSAGE rule (defaults to 0.001).

Add this line to local.cf (in the sa\ruleset directory of your installation):

```
score HTML_MESSAGE 5.0
```

Thanks. Let me give it a try. I will let you know if I get stuck.
