Subject: How to tell when CleanMail is idle?

I want to use some custom software to add entries to CleanMail's whitelist filter (the interface we use to release e-mails that have been 'accept/redirect'ed will also allow them to be whitelisted). That isn't a problem, nor is remotely restarting the CleanMail service so that new entries are recognised.

But what I would like to do is automatically delay any restart until a moment when there are no active incoming connections to CleanMail. The CleanMail admin program shows the number of active connections - how can I get this information to my own software (that I'm writing)?
