Could you add a configuration option for the dnsrcbls filter that makes it possible to define the amount of points a mail gets by dnsrcbl check ?

Problem now:

A customer from domain xyz.com (e. g. with usually -2.1 points) starts travelling and gets a dynamic ip. His mail is rejected by the dnsrcbl filter, because the dynamic ip is blacklisted.

Better:

If he would get e. g. 4 points for the DNSRBL Filter the mail would pass because of his AWL-Score. (the same way the spamassassin integrated DNSBL feature works).

The DNSBL filter does not involve scores or SpamAssassin. A mail is either blocked or passed.

Be very careful when you choose the DNSBL zones queried by the filter. The default setting does not query zones that include dynamic IP addresses.
