In running SA Learn, I notice the statement "No Configuration Text or Files Found" in the DOS dialogue. The program then proceeds to examine and learn, but I am concerend that what is learned is not being used from those messages that I have fed to the filter.

The command I am using is "sa-learn.exe --spam --showdots D:\site1\spam", where "D:\site1\spam" is the location I upload .eml message files that my Outlook express filter catches.

Using the -D option I find:

```
C:\Documents and Settings\webmaster\Desktop\N0-Spam Today>cd C:\Program Files\No
 Spam Today!\sa

C:\Program Files\No Spam Today!\sa>sa-learn.exe --D --spam --showdots D:\site1\s

Press any key to continue . . .

Any thoughts on why I am getting this message?

Thanks!

Please make sure you are using sa-learn this way:
cd [NoSpamTodayInstallationPath]
sa\sa-learn -c sa\ruleset --spam MessageFile
or
sa\sa-learn -c sa\ruleset --spam --mbox "[FolderPath]"

See also this HOWTO document on our website:

Thanks for the information regarding the path i.e. sa\ruleset

For others using local (client) detection of spam and using Outlook Express (.eml and .dbx folders), I found a freeware product (dbxconvert) that converts .dbx mailboxes to .mbx. Automating this via a batch file (on the client) allows one to upload the .mbx folder for SA-learn processing.

It simply copies the collection of spam to the dbxconvert directoy I created in C:, process the .dbx file and then deletes it, as folows:

```
cd\
cd\Documents and Settings\Ed Daniel\Local Settings\Application
Data\Identities\{7E910D46-1F80-4F7E-8E4C-5EE469664F70}\Microsoft\Outlook Express
copy spam_save.dbx c:\mail_convert\*.*
cd\
cd\mail_convert
dbxconv -mbx *.dbx
del *.dbx
pause
```

Where C:\mail_convert is the directory that dbxconvert resides in and spam_save.dbx is the folder I created in Outlook Express that I move confirmed Spam emails to.

I also have a batch file on the server to call sa-learn, as follows:

```
cd C:\Program Files\No Spam Today!\sa
sa-learn.exe -c ruleset --spam --mbox --showdots D:\site1\spam
pause
```

One optimization I could add is a VBS routine to auto aupload the file to the server via FTP and schedule the client and the server process. Worth considering.

I handle HAM similarly, with slightly different batch files.
