We were running version 1.x with no problem. Downloaded V2.0.4.4 off your website today, installed it over the old version. We started having memory problems similar to what was posted at <http://www.byteplant.com/forum/read.php?f=1&i=430&t=430>

Anytime the NoSpamToday Admin service was started memory usage crept up (over the course of 5-10 mins) until the machine was thrashing.

Uninstalled, moved the old folder from Program Files, and did a fresh install. Same problem. Turns out that sa\rulesets\local.cf is over 500MB in size!! Is that normal? (By contrast, the local.cf from version 1.x is only a few KB).

Windows 2000 Server service pack 4 running on an HP Proliant DL140 rackmount, 1 Gig Ram, 2.4 Ghz Xeon. Novell client, Norton Antivirus realtime filescan.

The first time we enabled the Bayes pre-learning. Second time we did not. Our NoSpamToday forwards to an SMTP server running on a separate box (Lotus Domino, if it matters). Otherwise pretty much default settings, but no message attachment rejection, and no antivirus programs hooked to NST.

EDIT: We went to V2.032, and don't see the huge 500MB local.cf I also noticed that V2.044 had a 500MB file called t_local.cf in the root NST folder (C:\Program Files\NoSpamToday\t_local.cf)

Thanks.
