Hi,

I just received following demand from my customer.

We have 2 mailservers, 1 in production and 1 new in test. We also have a test domain name.

Based on the domain name we would like to forward the controlled email to either of the server.

NoSpamToday is running fine on server 10.0.0.1

Lansuite (old mailserver in production) is running at 10.0.0.2

The new server is running Mailenable at 10.0.0.30

If the send sends to domainname.be then the mail needs to be forwarded to server 10.0.0.30, if the domainname = .com or .net then it needs to be forwarded to the normal mail server at 10.0.0.2.

Can this be done?

Thank you for helping me.

PS/ NoSpamToday has 1 SMTP filter.

Please configure a separate SMTP proxy in NST for each of your mail servers and redirect incoming SMTP traffic for each of these domains to the appropriate SMTP proxy in NST. If you like, you can even have one dedicated SMTP proxy in NST for each single domain.
