I'm getting ready to upgrade but before I do, I think I need some clarification. I noted that there is mention to leave your NST in place and allow CleanMail to upgrade. Which is great but, when you start the CleanMail install, it prompts you (by default) to install into a directory called "CleanMail". If your NST is running in the default "No Spam Today!" directory, do we point the CleanMail install to the "No Spam Today!" directory? Or, do we allow it to create the "CleanMail" directory? And if we do create the new directory, does it import configs from the old directory into the new?

I don't really care what directory its in. So, with that said, what is the preference?

Thanks.

We recommend to install CleanMail into its own folder.

The installer will take care that your settings will be transferred from the NoSpamToday folder to the new CleanMail folder.
